

WAVEFRONT TECHNOLOGY SOLUTIONS INC.

PRIMAWAVE SUCCESSFUL IN FIRST AUSTRALIAN APPLICATION

EDMONTON, Alta Nov 24, 2009/ Wavefront Technology Solutions Inc. ("Wavefront"), a world leader in providing innovative solutions for increasing oil field production and enhancing the treatment of contaminated groundwater, has successfully used Primawave in Australia for the first time to inject chemical oxidant into a groundwater aquifer previously very resistant to injection.

Primawave was used to inject more than 12,000 liters of fluid over 1.5 days at a gas station operated by an Irving, Texas-based global oil producer. Previous injection efforts at the site had only delivered approximately 2,000 liters over a similar time frame. In addition, monitoring points showed the radius of the injectate's influence with Primawave approaching six meters in comparison to previous non-Primawave injection events which did not show the presence of the injectate at any monitoring points on site. The client deemed the overall results to be very successful and it is anticipated that project planning for future site work will incorporate Primawave technology into the basis of design.

"Wavefront is delighted with the success of this project in Australia in conjunction with our licensed Primawave provider, Coffey Environments," said Wavefront President and CEO Brett Davidson. "More than 40 per cent of the world's developed land is contaminated to some degree. Although the demand for site remediation continues to grow daily around the world, conventional site remediation technology tends to be costly, lengthy and sometimes near impossible under difficult circumstances. Site owners and regulators are looking for advanced solutions to address these challenges and close the existing technological gap. Primawave meets these demands and is also cost-effective since it enhances existing site remediation technology without the need to invest in expensive new systems."
